

ICVERIFY® for Windows® Enterprise Edition

ICVERIFY® for Windows® Enterprise Edition software from First Data helps merchants who want to host their own payment processing.

The Challenge

Merchants need to handle an ever-increasing variety of transaction types, and they want a solution that can process transactions simply, reliably and quickly. Merchants also need to make the most of their technology investment with a solution that will be able to grow along with their business.

The Solution

The ICVERIFY Enterprise Edition software allows merchants to handle all their transaction types from a single server. Offering excellent performance and reliability, this software supports dial-up for smaller merchants, high-speed Internet for midrange and larger merchants and frame-relay connections. Plus, the ICVERIFY product line is one of the few full-service, full-feature offerings that is PABP-validated (Payments Applications Best Practices) by VISA in order to be compliant with all applicable data security standards and practices for payment software providers. System management is easy with an intuitive user interface for browsing, editing and managing transactions, and a server status window that shows performance, status and event history at a glance. The number of merchant accounts supported is limited only by merchant system resources.

Here's How It Works

ICVERIFY Enterprise Edition software integrates all payment applications, including e-commerce websites, call centers, interactive response systems and physical stores, into a single payment server. Client-server architecture means reconciliation is simple with a centralized transaction database, and application access across multiple clients can be centrally administered and managed.

Whether for online stores, sales departments, customer support, voice response systems or brick-and-mortar stores, our ICVERIFY Enterprise Edition solution addresses the needs of small- to enterprise-scale e-commerce, offering excellent performance and reliability.

ICVERIFY® for Windows Enterprise Edition

Help Your Business

- Manage transactions and batches with create, delete, import, export and other functions
- Send transactions to processors with Secured Sockets Layer (SSL) protocol and virtual private network (VPN) Internet access
- Reduce processing time for merchants and consumers
- Grow processing capabilities along with your company
- Maintain software investment with periodic upgrades
- Support Verified by Visa® and MasterCard® SecureCode® authentication
- Utilize client/server architecture, allowing multiple users to access a single server and a common connection to bank network

Help Your Customers

- Reduce risk for fraud
- Choose from a wide variety of payment methods
- Spend less time making purchases

Features

- Support for retail, card-not-present and e-commerce transactions
- Encrypted data storage and privilege-based user access
- Payment Application Best Practices (PABP) validated by Visa® for top-quality security and data encryption
- Support for dial-up, high-speed and frame-relay connections.
